

General Rules and Regulations

20.42 NET METERING RATE

APPLICABILITY

Applicable to all eligible Consumer-Generators served by the Association.

AVAILABILITY

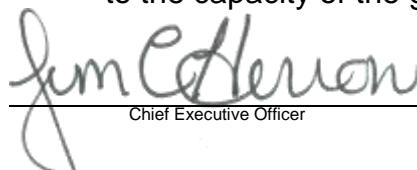

Available to all Consumer-Generators with an Eligible Generating System connected to the Association in accordance with the Association's General Rules and Regulations

DEFINITIONS

Consumer-generator: means an Association member who is an end-use consumer of electricity that generates electricity on the consumer's side of the meter using an Eligible Generating System for the purpose of offsetting the consumer's electric energy requirements at the same location.

Eligible Generating System: means an electric generating system which:

1. Has a total aggregate nameplate generating capacity, from single or multiple generators, not greater than 10 kW for residential rate classes; and
2. Has a total aggregate nameplate generating capacity, from single or multiple generators, not greater than 25 kW for all rate classes other than residential; and
3. Uses as its energy source: solar, wind, geothermal, biomass, hydro or a system that converts the otherwise lost energy from heat from exhaust stacks or pipes to electricity and that does not combust additional fossil fuel. A fuel cell using hydrogen derived from one of the above energy resources is also an eligible electric generation system; and
4. Operates in parallel with the Association's electric distribution system; and
5. Meets all interconnection requirements of the Association's General Rules and Regulations; and
6. Is intended primarily to offset part or all of the consumer's electric energy requirements at the same location, and will not be used to offset or provide credits for electric consumption at any other location or for any other consumer. The Association, in its sole discretion, reserves the right to refuse net-metering to consumer-generators that have limited electric energy requirements when compared to the capacity of the generating system.

General Rules and Regulations

20.42 NET METERING RATE

Energy Credit: means the measured difference between the electricity generated by the Eligible Generating System and the electricity consumed by the Consumer-Generator in a given billing period, when the electricity consumed is less.

Net Metered Energy: means the measured difference between the electricity consumed by the Consumer-Generator and that generated by the Eligible Generating System in a given billing period, when the electricity generated is less.

RATES AND CHARGES

1. The consumer will be billed monthly under the Association's applicable rate tariff for the consumer's premises. The consumer will be billed for the applicable grid access and demand charge each month without regard to the level of electricity generated.
2. In any billing period when the Consumer-Generator generates more electricity than is consumed by the Consumer-Generator, all such excess energy, expressed in kWh, will be carried forward to subsequent billing periods as an Energy Credit.
3. In any billing period when the Consumer-Generator uses more electricity than is generated by the Eligible Generating System, the Association will bill the consumer an energy charge based on the Net Metered Energy usage for the billing period less any accrued and unused Energy Credits from prior months.
4. Annually, within sixty (60) days after the end of each annual billing period, or within sixty (60) days after the Consumer-Generator terminates retail service, the Association will pay the Consumer-Generator for any remaining unused balance of Energy Credits at the Association's average cost of power and energy for the twelve month period ending December 31.
